

RUM **Community Group**

2026-03-11 Edition

Agenda

- Interop 2026 updates (Nic)
- Unused Preload RUM (Yoav)
- Core Web Vitals (CWV) across the browsers (All)
- Server-timing header adoption updates (Cliff)

Logistics

- Meeting cadence
 - 2nd Wednesday of the Month
 - 60 minutes
 - 10am ET
- Agenda Document
 - (bit.ly/rumcg-agenda)
- Google Meet for Meetings
 - sub to [rumcg-participants](#) for invites
- Chat on Web Performance Slack
#w3c-rum-community-group
 - ([invites](#))
- public-rumcg@w3.org
 - (for discussions)
- RUM CG Github Repo
 - github.com/w3c-cg/rum
 - Group details
 - Links
 - Meeting minutes
- RUM CG Tracking Project
 - github.com/orgs/w3c-cg/projects/1
- Meeting Minutes via fireflies.ai
 - AI summary + transcript will be posted after
 - Full video recording also available

Next Meeting

- Wed **April 8th** @ 10am EST
 - 2nd **Wednesday** of each month
- Topics?
 - Bot and bad actor detection (bad CWV bots)
 - AI browsers
- Submit & Vote topics @ bit.ly/rumcg-agenda

Topics Backlog

- Better tracking/visibility into vendor positions (March 14)
- Top tracking issues (e.g. this [lighthouse issue](#)) (March 14)
- Baseline Project
- Funding browser work for features
- Header adoption (TAC, Server timing)
- Browser vendor presentations
- Outreach to other groups (i.e. 3rd Parties, CDNs)
- Ad Blockers & tracking protection
- Implementation best practices
 - When to fire the beacon/how to deliver
 - SPA support
- Making sure we don't step on each other's toes (i.e. clearing RT buffers, multiple vendors on a page, etc.)
- Open source
- Securing the beacon
- RUM Archive
- Callstacks from input delays (Issac Gerges [thread](#) in #general)
- Container Timing awareness
- ServerTiming / trailers
- Bot and bad actor detection (bad CWV bots)
- AI browsers

here we go yo

Interop 2026

- <https://web.dev/blog/interop-2026> (blog)
- <https://wpt.fyi/interop-2026> (dashboard)
- Carryover Evaluation for Core Web Vitals
 - <https://github.com/web-platform-tests/interop/issues/1173>
 - > *Thank you for proposing Carryover evaluation for Core Web Vitals for Interop 2026.*
 - > *We want to let you know it was not selected to be part of Interop this year.*
- Not included for 2026:
 - CLS
 - scheduler
 - requestIdleCallback
 - Speculation Rules

Unused Preload RUM

- https://github.com/WICG/speculative_load_measurement/blob/main/README.md

@yoavweiss, @tunetheweb

Speculative load measurement API

Introduction

Modern web applications can use speculative loading techniques to improve navigation performance. However, developers currently lack visibility into whether these speculations were actually used, making it hard for them to deploy higher eagerness values than "conservative". Such values can result in wasted user bandwidth and server-side load, and currently developers have no way to weigh the trade-off between those and potential performance gains.

This proposal addresses this by exposing information about used and unused speculative loads on page dismissal, enabling developers to measure speculation effectiveness and optimize their speculative load strategies, to pick the trade-off that's right for them.

Use-cases

When experimenting with speculative loads, developers need to be able to answer questions such as:

- Does preloading more/certain resources cause the site's performance metrics to get better or worse?
- How often do my preloaded resources go unused? Which preloaded resource should I stop preloading?
- Is more aggressive prefetching/prerendering worth the cost tradeoff? User performance improves by X%, but server-cost is increased by Y%.
- What links should I stop prefetching/prerendering, as they almost never get used?
- What's the benefit from moving preloads to use Early Hints?

This proposal aims to enable developers answering those questions.

Goals

1. Enable developers to measure the effectiveness of their speculation rules and preload strategies.
2. Expose relevant metadata ([speculation rules tags](#), as attribute values) to make the above measurement actionable.
3. Only expose speculation data after the page starts [unloading](#), to reduce potential confusion.
4. Only expose data on user actions in the current document (even for cross-origin speculative loads), without exposing cross-origin data.

CWV Across Browsers
